INFORMATION REPORT INFORMATION REPORT

~~SECRET~~

1. A new missile, "SP-5", has started to enter into service. The SP-5 missile is built on the basis of the P-5 missile. (This is a submarine missile mounted on submarines and a few other naval vessels.) This missile was modified, given the designation "SP-5" (special), and is now being introduced in the Ground Forces.

2. Some characteristics of the missile:

- a. The missile is winged, i.e., upon leaving the launcher, two wings emerge from channels (for stabilization in flight).
- b. The length of the missile is 17 meters.
- c. The dry weight of the missile is about 1.5 tons.
- d. The weight of the fueled missile is about 5 tons.
- e. The basic fuel is kerosene.
- f. The flight range is 600 km.
- g. Trajectory height is 1,000 meters.
- h. The warhead can also carry an atomic charge.
- i. Launch is not vertical but inclined, from a special launcher.
- j. As oxidizer, atmospheric oxygen is used.

The P-5 missile can be launched from a submarine while it is submerged.

3. Source Comment: Thus, there are three types of missile with the index "5" -- the "R-5", the "P-5", and the "SP-5"; the last-named missile is still called "the winged one (krylatka)". The R-5 is a ballistic missile with a range in excess of 1,000 km, but no further details are known.

**SECRET**

РАКЕТА СП-5

Начала поступать на вооружение новая ракета "СП-5".

Ракета СП-5 сделана на базе ракеты "П-5" (существует такая подводная ракета, установленная на подводных лодках и на некоторых других морских судах). Эта ракета была несколько модернизирована, получила название "СП-5" (специальная) и в настоящее время внедряется в сухопутных войсках.

Некоторые данные ракеты:

- ракета крылатая, т.е. при сходе с установки из пазов выходят два крыла (для стабилизации в полете).
- длина ракеты 17 метров.
- сухой вес ракеты около 1,5 тонны.
- вес заправленной ракеты около 5 тонн.
- основное горючее - керосин.
- дальность полета ракеты - 600 км.
- высота траектории - 1000 метров.
- головная часть ракеты может нести и атомный заряд.
- старт не вертикальный, а наклонный со специальной пусковой установки.
- в качестве окислителя используется вод воздуха.

Ракета "П-5" может запускаться с лодки, находящейся в подводном положении.

Итак, с индексом "5" существуют три вида ракет: "Р-5", "П-5" и "СП-5" - эту ракету называют еще "крылаткой".
